8 Diagnostic strategies with ECG and blood serum cardiac markers were used to rule out acute myocardial infarction in 6 to 12 h. The present study evaluated whether a multimer strategy that used point-of-care measurement of myoglobin, creatine kinase (CK)-MB, and troponin I could exclude acute myocardial infarction in ≤3 h. We prospectively enrolled consecutive patients (n=817) in the emergency department who were evaluated for possible acute myocardial infarction. In patients with nondiagnostic ECGs, we

NGUAGE: Conference
English

The contribution of plasma brain natriuretic peptide (BNP) levels and that of plasma cardiac troponin I (TNIC) levels toward increasing the sensitivity and specificity of diagnoses of coronary lesions were compared. Although BNP and TNIC had the same specificity, BNP was more sensitive than TNIC in identifying patients with acute chest pain and coronary artery disease. Plasma BNP at < 10 pg/mL was capable of identifying patients without coronary lesions.
